Pharmaceutical Spray Coating System

Control & Automation Companies (CAC) Spray Coating System is a programmable spray system that can be custom configured to deliver a precise application of solution.

The system features the CAC patent pending nozzle technology and patent pending environmental controlled spray chamber system.

The CAC nozzle utilizes low-pressure energy to shape and focus the spray pattern and droplet size.

The CAC environmental control spray chamber system controls the spray environment to reduce solution oxidation initiation and can be designed to meet various products feed through systems.

The spray system provides a precise coating application that can be configured with single or multiple axis movement of the spray nozzle.

The CAC Spray system can be tailored to include processing features required to meet the product manufacturing needs.

Features:

- Stationary, single or multiple axis movement of the nozzle
- IV bag closed loop solution dispensing technology
- Closed loop process controls minimize operator interface
- CAC patent pending environmental controlled spray chamber system
- CAC patent pending nozzle technology
